Hence, by retracing our steps, we learn that the equation $x - 6x - 16$ can be solved by first adding $(3)^2$ or 9 to each side, and then extracting the square root; and the reason why we add 9 to each side is that this quantity added to the left side makes it a perfect square. 194. We have shewn that the square may readily be completed when the coefficient of x^2 is unity. All cases may be reduced to this by dividing the equation throughout by the coefficient of x^2 . Example 1. Solve $3x^2 - 3a - 10x$. Transposing, $3x^2 - 10x = 3a$. Divide throughout by 3, so as to make the coefficient of x^2 a unity. Thus $x^2 - \frac{10}{3}x = a$, 195. We see then that the following are the steps required for solving an affected quadratic equation: (1) If necessary, simplify the equation so that the terms in x^2 and x are on one side of the equation, and the term without x on the other. . . (2) Make the coefficient of x^2 unity and positive by dividing throughout by the coefficient of x^2 . (3) Add to each side of the equation the square of half the coefficient of x . (4) Take the square root of each side. (5) Solve the resulting simple equations. 196. In the examples which follow some preliminary reduction and simplification may be necessary. Example 1. Solve $-5 - V - 2 3x - 2 - 3x - 8$ Simplifying, 197. In all the instances considered hitherto the quadratic equations have had two roots....
